

SIMPLIFY EMPLOYEE MANAGEMENT WITH EPMS

Requirements:

- This demo is currently developed in a small test environment using XAMPP on a desktop. This uses an Apache PHP back-end and a MariaDB database.
- In a production environment, this would be on a standalone server hosting its own database or connected to a larger SQL Server.
- The front end can be accessed via a web browser pointing to the location where the site is hosted.

Features:

- Central location to enter and maintain employee information
 - The website works like a formatted list. Each entry is populated to a table that is updated with each addition.
- Comprehensive record addition
 - Each field is checked for proper data entry as it is entered.
- Hassle-free record deletion
 - Removing records is only a few clicks.
- Easy record modification
 - No need for deletion and recreation, editing allows for the current information to be pulled up and edited.
- Easy record lookup
 - All fields are searchable and a comprehensive list is returned based on keywords.
- Role-based access
 - Access to the data is restricted via account and accounts have either read-only or full edit access.
